

A SYSTEM AND METHOD  
FOR ADVANCED NETWORK VIEWING

ABSTRACT

A system and method for advanced network viewing is disclosed. In accordance with one aspect of the invention, a system and method for generating a representation of a linked site is disclosed. A user may view the contents of a linked site from an original site accessed by the user without manually accessing the linked site. One method of accomplishing this task includes the steps of accessing a first site; querying at least one of a link and a second site linked to the first site; generating a representation of the linked second site; and communicating the representation wherein the representation enables a user to preview the linked second site. In an exemplary embodiment of the present invention the representation may comprise a thumbnail representation of the second site so that users may preview the contents of the second site by accessing the first site.
